

BOTANY.—*Additional Fijian mosses, III.* EDWIN B. BARTRAM, Bushkill, Pa.

(Received September 25, 1956)

The mosses collected by Dr. A. C. Smith on his latest expedition to Fiji, April to December 1953, under the auspices of the Smithsonian Institution and the National Science Foundation, are represented by 136 numbers, many of which are in generous quantity for wide distribution. For the most part the collections duplicate previous gatherings but are of interest from the standpoint of local distribution. Three new species, *Syrrhopodon vitiensis*, *Thyridium parvifolium*, and *Chaetomitrium smithii*, together with a new variety of *Chaetomitrium orthorrhynchum*, a species new to the local flora, and *Thamnum ellipticum*, not previously known from Fiji, are the outstanding features of the series. The list of Fijian mosses now numbers about 288 species of which 75, or approximately 25 per cent, are endemic. Further explorations may expand the list to some extent, but it seems likely that the flora as now known is reasonably complete.

A representative series from this collection is in my herbarium and a complete set in the United States National Herbarium.
